

THE ENZYMIC TRANSFER . . .

the phosphorylation of I similar to that of IV is characterized by high energy properties. The quantity of excess bound P in phosphorylated I amounted to 40% of the phosphate of I prior to its phosphorylation. Eighty % of the total high energy phosphate of the phosphorylated I was consumed in the process of the enzymic transfer. A considerable lowering in the amount of free energy occurred during the reaction. During the phosphorylation of I, a pyrophosphate grouping takes place at C-5 position of ribose which in the succeeding steps of the reaction served as a donor of phosphate groups.

TITLE: Zoological factors in the existence of several natural foci of tularemia

SOURCE: Zhurnal mikrobiologii, epidemiologii i immunobiologii, no. 6, 1965, 80-86

TOPIC TAGS: tularemia, epizootiology

ABSTRACT: The authors describe a July 1956 outbreak of tularemia among water rats (*Arvicola terrestris L.*) living along a brook in the foothills of the Altai (Krasnogorsk Rayon). Affected animals constituted 27% of the water rat population. The mortality occurred and 12% of the

to the summer, coinciding with the period of

2

Moreover, it was concentrated within a small area. Epizootics in the subalpine brook foci do not spread too far because the populations of the individual brooks have little contact with each other during the summer. In summary, all the tularemia foci in the mountain and subalpine brook zones studied have the following

nymphs. Orig. art. has: 2 figures, 2 tables.

✓ 5628 Enzymic transfer of phosphate from ribonucleic acid to fructose monophosphate. I. L. Dresler and H. M. Rubina. Biochimia, 1960, 30, 743-748 (Dept. of Biochem., I. P. Pavlov Med. Inst., Leningrad, U.S.S.R.).—Brewers' yeast RNA underwent phosphorylation with [³²P]ATP in homogenates of rat liver or brain. Phosphorylation was greatest at pH 7.6 with liver homogenates using BaSO_4 to deactivate phosphatases. The enzyme concerned was identified with myokinase. Pure prep. of phosphorylated RNA were obtained by the action of purified myokinase on RNA from calf pancreas. The RNA P content was increased in this way by 30-65%. The phosphorylated RNA had many properties analogous to ATP, i.e. it is a "high energy compound" since it transferred phosphate to fructose monophosphate giving fructose diphosphate. It is suggested that the phosphorylated RNA contains an additional pyrophosphate group in the 5 position in the ribose ring. (Russia) A. K. Gazybowski.

TITLE: Optical cement for joining organic-glass light pipes to photomultipliers

SOURCE: Pribory i tekhnika eksperimenta, no. 1, 1966, 201-202

TOPIC TAGS: cement, organic glass, phenyl compound, polystyrene, optic material, optic piping, adhesion, photomultiplier/FEU-29 photomultiplier

ABSTRACT: The authors investigated a cement based on polystyrene, using phenylcyclohexane (of scintillator purity; VTU-ORU 74-57, Khar'kov Chemical-Reagent Plant), with an aim at finding a substitute for the various hitherto employed high-boiling-point compounds, which have a low yield. The most suitable cement viscosity can be adjusted by varying the polystyrene content (from 20 to 50 wt.% of phenylcyclohexane). Although the cement becomes more viscous in time, it does not solidify and the parts fastened with it can be easily replaced. Other advantages are good adhesion and absence of chemical interaction with the crystals or light pipes, and the fact that phenylcyclohexane is commercially available. The spectral characteristics of the cement were measured by means of a plastic scintillator in optical contact with the photocathode of a photomultiplier (FEU-29) and exposed to 5.27-Mev α particles from Am²⁴³. The pulse-height spectrum obtained with the cement agreed within experimental

TITLE: Scintillation properties of polyphenyls. Report, 13th Conference on
Luminescence held in Khar'kov 25 June to 1 July 1964

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 29, no. 8, 1965, 1417-1418

TOPIC TAGS: luminescence, scintillation, solution property, gamma radiation,
radiation detector, organic compound

ABSTRACT: The authors have measured the relative intensities of the scintillations initiated by Co^{60} gamma rays in solutions of polyphenyls in polystyrene, toluene and phenylcyclohexane. The polyphenyls investigated were: diphenyl, n-terphenyl, n,n'-quaterphenyl, and pentaphenyl. The scintillation intensity increased with concentration at low concentrations, but this effect reached a saturation; the maximum scintillation amplitude of diphenyl and terphenyl was reached at concentrations of 0.05 and 2%, respectively, and increasing the concentration even to 5% did not further increase the intensity. At concentrations up to 0.05% the scintillation intensity increased linearly with the number of phenyl

AUTHOR: Rubina, P.M., Engineer

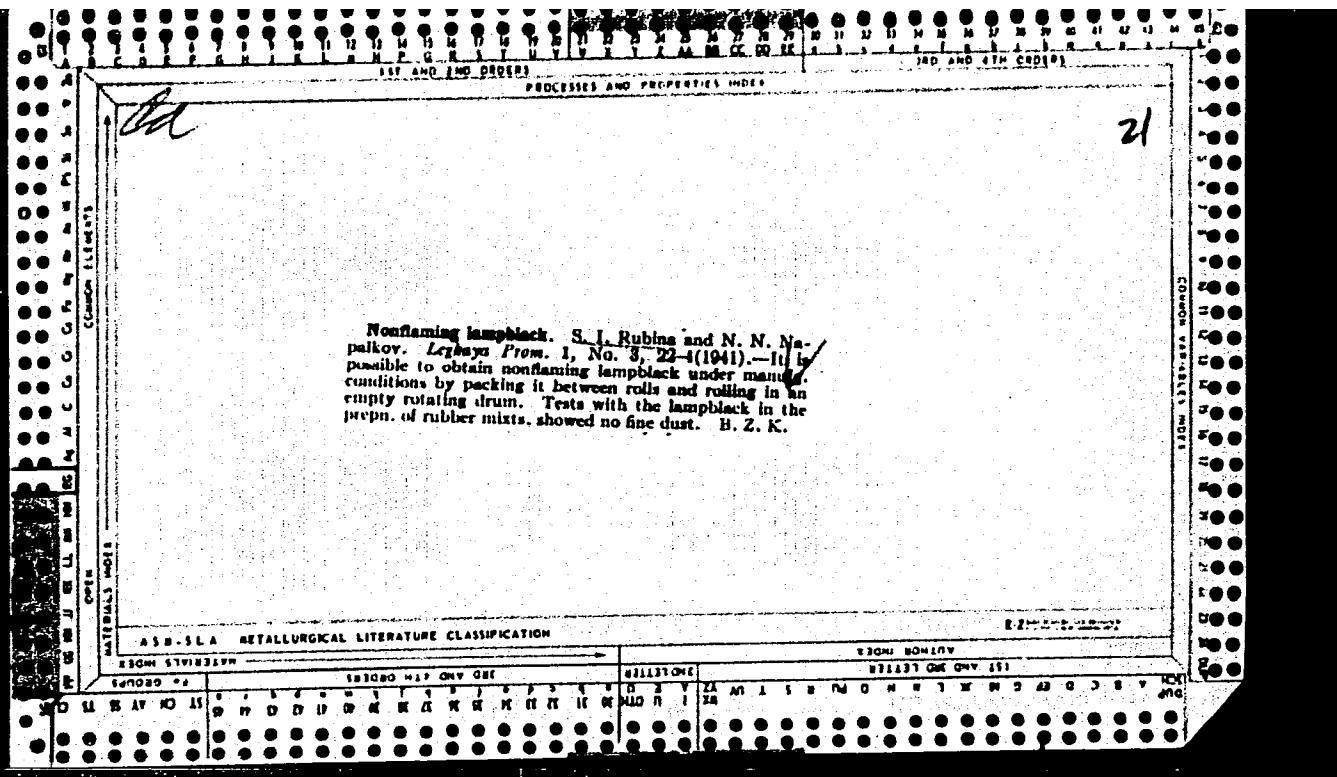

TITLE: Each Communication Enterprise Must Have a Future Plan
for the Seven-Year Plan

PERIODICAL: Vestnik svyazi, 1959, Nr 5, pp 26-27 (USSR)

ABSTRACT: The author states that communication enterprises should have future plans besides the annual operation plans. The future plans must be worked out carefully, taking into consideration the future development of the USSR. Such plans have been developed at a number of communication enterprises concerning organizational and engineering measures to be taken in the future when activating communication facilities.

"Investigation of Structures in Carbon Black Suspensions. 1. Effects of the Velocity of Flow, Time, Temperature, and Concentration of Carbon Black on the Structure of Carbon Black Suspensions," S. S. Voyutskiy, A. D. Zayonchkovskiy, V. A. Kargin, S. I. Rubina, Cen Sci Res Inst of Leather Substitutes, Moscow

"Kolloid Zhur" Vol XIII, No 5, pp 333-338

Developed method for detg structure formation in carbon black, which is based on measurement of elec cond without destruction of structure. Demonstrated existence of elec cond in very dil carbon black suspensions both in static condition and in flow. Using new method, studied effect of flow velocity on structure and dependence of structure on time, temp, and concn. Demonstrated that carbon black particles have nearly constant diam throughout particle.

"Investigation of Structure Formation in Carbon Black Suspensions," S.S. Voyutskiy, A.D. Zayonchkovskiy, V.A. Kargin, Corr Mem, Acad Sci USSR, S.I. Rubina, Cen Sci Res Inst of Leather Substitutes

"Dok Ak Nauk SSSR" Vol LXXVI, No 3, 419-422

Subjected suspension of carbon black in oil to action of rotating cyl of electrically driven M.V. Volarovich PB-4 viscometer. Found elec cond of the suspension to be reduced perpendicularly to direction of flow and increased in direction of flow due to orientation. Cond increased with increasing temp by reason of formation of coagulationsstructures wit increased contact s rfce between particles. Although greater at higher concn, cond is still quite prominent at low cancn.

Title : Cases of Tularemia Infections from a Hare

Orig Pub : Tr. Molotovsk. med. in-ta, 1957, vyp. 26,
190-191

Abstract : In the use of cooked food, as well as raw
(salted) meat of a hare, 4 members of a family
fell ill. Two died in 2-3 days of sickness
(a woman of 60 years and a girl of 1½ years.)
In those who recovered, an intracutaneous aller-
gic reaction to tularin was established and
antibodies to the tularemia antigen were found
in the blood serum (serum titers were not in-
dicated). -- T.N. Dunayeva

TITLE: On the Mechanism of Fluorochlorobenzene Amination by Metal
Amides and Aqueous Ammonia

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 127, Nr 6, pp 1225-1227
(USSR)

ABSTRACT: As is known, neither fluorobenzene (Ref 1) nor fluorotoluene (Ref 2) react with the alkaline metal amides in liquid ammonia. The amination of compounds containing various halogens has hardly been investigated (Refs 3, 4). The authors studied the amination mentioned in the title in liquid and aqueous ammonia in the presence of copper chloride. In all cases investigated here, the chlorine atoms were replaced by the amino group. Neither the yield nor the composition of the amination products are practically influenced by the replacement of the sodium amide by lithium- or potassium amides. Table 1 shows the experimental results. A. N. Shikanov, student, took part in the experiments. The spectrum analysis was made by V. A. Plakhov. According to the authors' results, fluorobenzene is practically not aminated by aqueous ammonia at 250° within 6 h. The amination by metal amides

Card 1/3

On the Mechanism of Fluorochlorobenzene Amination by
Metal Amides and Aqueous Ammonia

SOV/20-127-6-22/51

probably proceeds via an intermediate formation of substituted dehydrobenzenes (Ref 3). The same product (I) is apparently formed from the o- and m-fluorochlorobenzene, while the product (II) is formed from the para-isomer. The isomeric composition of the amination products confirms the assumption concerning the influence of the inductive effect of the electronegative substituents (here fluorine) on the addition direction of the NH_2^- ion to substituted dehydrobenzenes (Ref 3). The mechanism of the catalytic exchange of the aromatically bound chlorine, as suggested by the 1st author (together with V. A. Kobelev, Ref 5), is recalled. According to this mechanism, the reaction starts with the addition of the catalyst to the molecule of the halogen derivative (see Scheme). In the addition product, the halogen is already very mobile, and reacts easily with ammonia whereby an amine is formed. Finally, some deliberations are made on the nature of the complex, on the basis of the above-mentioned results. There are 1 table and 6 references, 2 of which are Soviet.

TITLE: About Certain Beta-Amino Acids of the Thiophene Series (O nekotorykh beta aminokislotakh ryada tiofena)

PERIODICAL: Zhurnal Obshchey Khimii, 1957, vol 27, No 2, pp. 464-466 (U.S.S.R.)

ABSTRACT: Employing the V. M. Rodionov method, the authors synthesized beta-(3-thienyl)-beta-aminopropionic and beta-(2-ethyl-5-thienyl)-beta-aminopropionic acids respectively from beta-thiophenaldehyde and 2-ethyl-5-thiophenaldehyde. In addition to the beta-amino acids, the authors obtained beta-(3-thienyl)-acrylic and beta-(2-ethyl-5-thienyl)-acrylic acids. Maximum yields of beta-amino acid were obtained during the reaction of aldehydes with amlonic acid in the presence of ammonium acetate. The formation of beta-amino acids from beta-thiophenaldehyde was considerably easier than from alpha-thiophenaldehyde. It was proven that the Rodinov method can be used for the derivation of beta-amino acids of the thiophene series.
